Study Notes - 1

IF condition-

In Python, an if condition is used to execute code based on whether a specified condition is true. If the condition evaluates to true, the indented block of code following the if statement is executed. Otherwise, it can check additional conditions using elif or run a default block with else.

Example

```
x = 4
```

```
if x > 5:
    print("x is greater than 5")
elif x == 5:
    print("x is equal to 5")
else:
    print("x is less than 5")
```
